

Stair Pre-Assembly Preparation

For a hassle-free installation, a suitable assembly area should be identified and prepared, and the following checks should be made prior to assembly commencing.

- 1 Clean the area where the stair will be assembled and fitted.

- 2 Load the staircase into the plot and ensure it is stored on bearers (wall string down). Check for any signs of damage.

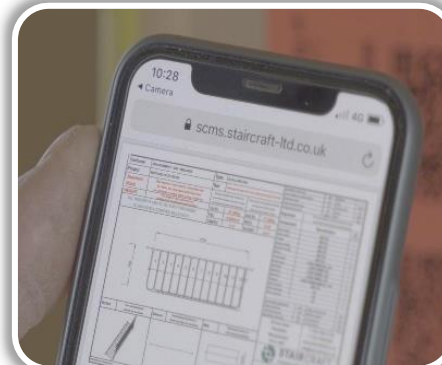

- 3 Check the stair is in the correct plot and note the finished floor height shown on the Traceability Label.

- 4 Measure the actual finished floor height and check this matches the Label.

- 5 Scan the QR code on the Installation Label to view the Stair Graph.

- 6 Check all components on the Stair Graph are present before starting the assembly.
